Outline

Motivation

- Universal Designated-Verifier Signatures
- Identity-Based Signatures

Research Question

- Research Question
- Formulation of Patterns

Results

- Our UDVS Construction and Its Security
- Our IBS Construction and Its Security

Conclusion

- Concluding Remarks

Notes

- Final Notes

What's a Universal Designated-Verifier Signature?

a.k.a. UDVS

- ▶ Basically: a signature scheme with an extra functionality
- ▶ Goal: to protect user privacy when using credentials
- ▶ Idea: transform signature s.t. it only convinces a particular verifier

What's a Universal Designated-Verifier Signature?

a.k.a. UDVS

- ▶ Basically: a signature scheme with an extra functionality
- ▶ Goal: to protect user privacy when using credentials
- ▶ Idea: transform signature s.t. it only convinces a particular verifier

What's a Universal Designated-Verifier Signature?

a.k.a. UDVS

- ▶ Basically: a signature scheme with an extra functionality
- ▶ Goal: to protect user privacy when using credentials
- ▶ Idea: transform signature s.t. it only convinces a particular verifier

Credential Issuer

σ

Credential Holder

$\hat{\sigma}$

Credential Verifier

How can we construct a UDVS?

- ▶ $\hat{\sigma}$ is a designated-verifier non-interactive proof of holding a valid signature on m .
- ▶ Jakobsson et al's intuition to verifier designation: *“Instead of proving X , Alice will prove the statement: Either X is true, or I am Bob.”*
- ▶ In the Random Oracle Model, non-interactive proofs can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So the only things we need are:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message, and
 - ▶ A Σ protocol for proof of knowledge of the verifier's secret key.

How can we construct a UDVS?

- ▶ $\hat{\sigma}$ is a designated-verifier non-interactive proof of holding a valid signature on m .
- ▶ Jakobsson et al's intuition to verifier designation: *“Instead of proving X , Alice will prove the statement: Either X is true, or I am Bob.”*
- ▶ In the Random Oracle Model, non-interactive proofs can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So the only things we need are:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message, and
 - ▶ A Σ protocol for proof of knowledge of the verifier's secret key.

 - ▶ A Σ protocol for proof of knowledge of a signature on a message, and
 - ▶ A Σ protocol for proof of knowledge of the verifier's secret key.

How can we construct an Identity-Based Signature?

a.k.a. IBS

- ▶ σ is a signature on m that shows the signer has knowledge of usk
- ▶ In the Random Oracle Model, signatures can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So again the only thing we need is:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message.

How can we construct an Identity-Based Signature?

a.k.a. IBS

- ▶ σ is a signature on m that shows the signer has knowledge of usk
- ▶ In the Random Oracle Model, signatures can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So again the only thing we need is:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message.

How can we construct an Identity-Based Signature?

a.k.a. IBS

- ▶ σ is a signature on m that shows the signer has knowledge of usk
- ▶ In the Random Oracle Model, signatures can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So again the only thing we need is:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message.

How can we construct an Identity-Based Signature?

a.k.a. IBS

- ▶ σ is a signature on m that shows the signer has knowledge of usk
- ▶ In the Random Oracle Model, signatures can be constructed using Fiat-Shamir heuristic from Σ protocols.
- ▶ So again the only thing we need is:
 - ▶ A Σ protocol for proof of knowledge of a signature on a message.

So, What's the problem Then?

Although any NP relation has a Σ protocol, these generic protocols are normally not efficient!

Is there any more efficient way to do it?

Yes, There Is a Way!

We don't actually need strict honest-verifier zero-knowledge!

Example

Schnorr signature:

$$pk = (p, q, g, h = g^x), \quad \sigma = (c, z) : \quad c = H(g^z \cdot h^{-c}, m)$$

To prove knowledge of a signature

- ▶ give out $aux = g^z \cdot h^{-c}$
- ▶ prove knowledge of $z : \quad g^z = aux \cdot h^{H(aux, m)}$

Yes, There Is a Way!

We don't actually need strict honest-verifier zero-knowledge!

Example

Schnorr signature:

$$pk = (p, q, g, h = g^x), \quad \sigma = (c, z) : \quad c = H(g^z \cdot h^{-c}, m)$$

To prove knowledge of a signature

- ▶ give out $aux = g^z \cdot h^{-c}$
- ▶ prove knowledge of $z : \quad g^z = aux \cdot h^{H(aux, m)}$

Yes, There Is a Way!

We don't actually need strict honest-verifier zero-knowledge!

Example

Schnorr signature:

$$pk = (p, q, g, h = g^x), \quad \sigma = (c, z) : \quad c = H(g^z \cdot h^{-c}, m)$$

To prove knowledge of a signature

- ▶ give out $aux = g^z \cdot h^{-c}$
- ▶ prove knowledge of $z : \quad g^z = aux \cdot h^{H(aux, m)}$

Defining Class \mathbb{C} of Signatures

There exist `Convert` and `Retrieve` s.t.

$$\tilde{\sigma} \leftarrow \text{Convert}(pk, m, \sigma) \Rightarrow \sigma \leftarrow \text{Retrieve}(pk, m, \tilde{\sigma})$$

and if $\tilde{\sigma} = (aux, pre)$ then there exists:

- ▶ An `AuxSim` that `AuxSim(pk, m)` simulates *aux*, and
- ▶ A Σ protocol for proof of knowledge of a *pre* for known *pk*, *m*, and *aux*.

Defining Class \mathbb{C} of Signatures

There exist `Convert` and `Retrieve` s.t.

$$\tilde{\sigma} \leftarrow \text{Convert}(pk, m, \sigma) \Rightarrow \sigma \leftarrow \text{Retrieve}(pk, m, \tilde{\sigma})$$

and if $\tilde{\sigma} = (aux, pre)$ then there exists:

- ▶ An `AuxSim` that `AuxSim(pk, m)` simulates `aux`, and
- ▶ A Σ protocol for proof of knowledge of a `pre` for known `pk`, `m`, and `aux`.

Defining Class \mathbb{C} of Signatures

There exist `Convert` and `Retrieve` s.t.

$$\tilde{\sigma} \leftarrow \text{Convert}(pk, m, \sigma) \Rightarrow \sigma \leftarrow \text{Retrieve}(pk, m, \tilde{\sigma})$$

and if $\tilde{\sigma} = (aux, pre)$ then there exists:

- ▶ An `AuxSim` that `AuxSim(pk, m)` simulates *aux*, and
- ▶ A Σ protocol for proof of knowledge of a *pre* for known *pk*, *m*, and *aux*.

Defining Class \mathbb{C} of Signatures

There exist `Convert` and `Retrieve` s.t.

$$\tilde{\sigma} \leftarrow \text{Convert}(pk, m, \sigma) \Rightarrow \sigma \leftarrow \text{Retrieve}(pk, m, \tilde{\sigma})$$

and if $\tilde{\sigma} = (aux, pre)$ then there exists:

- ▶ An `AuxSim` that `AuxSim(pk, m)` simulates *aux*, and
- ▶ A Σ protocol for proof of knowledge of a *pre* for known *pk*, *m*, and *aux*.

Which Signatures Does Class \mathbb{C} Cover?

RSA-FDH, Schnorr, Modified ElGamal, Boneh-Lynn-Shacham, Boneh-Boyer, Cramer-Shoup, Camenisch-Lysyanskaya-02, Camenisch-Lysyanskaya-04, Goldwasser-Micali-Rivest, Gennaro-Halevi-Rabin, and Cramer-Shoup.

But not PSS of Bellare and Rogaway!

How to Construct a UDVS from a Signature?

Use signature to sign

To designate:

$$(aux, pre) \leftarrow \text{Convert}(pk_s, m, \sigma)$$

$$\delta \leftarrow \text{SoK} \{ (pre \vee sk_v) : \text{Valid}(pk_s, m, (aux, pre)), \text{Pair}(pk_v, sk_v) \}$$

$$\hat{\sigma} \leftarrow (aux, \delta)$$

Verification is straightforward.

Verification is straightforward.

Security of Our UDVS Construction

Let SS be any signature in \mathbb{C} and P_{SS} be its underlying problem. Also, let KT be any key type in \mathbb{K} and P_{KT} be its underlying problem. Then our UDVS construction:

- ▶ is *DV-unforgeable* if P_{SS} and P_{KT} are both hard.
- ▶ achieves *non-transferability privacy*.
- ▶ is *non-delegatable* if the challenge space of the proof protocol is big enough.

Security of Our UDVS Construction

ND: non-delegatability

Further Constructions

- ▶ *universal multi-designated-verifier signatures*: through non-interactive proof of knowledge of one out of $n + 1$ values: a (converted) signature and the secret keys of the n verifiers.
- ▶ designate more than one signature *at once*: e.g. to show at least k out of n certificates to a verifier, construct a non-interactive proof of knowledge of $k + 1$ out of $n + 1$ values: n (converted) signatures and the secret key of the verifier.
- ▶ a combination of the above two

How to Construct an IBS?

Use signature to issue user secret keys (signatures) on identities (messages)

$$usk \leftarrow \text{SS.Sign}(msk, id)$$

To sign:

$$(aux, pre) \leftarrow \text{Convert}(mpk, id, usk)$$

$$\delta \leftarrow \text{SoK}\{pre : \text{Valid}(mpk, id, (aux, pre))\}(m)$$

$$\sigma \leftarrow (aux, \delta)$$

Verification is straightforward.

$$\sigma \leftarrow (aux, \delta)$$

Verification is straightforward.

Security and Further Construction

Let SS be a standard signature in \mathbb{C} and P_{SS} be its underlying problem. Our IBS construction is ID-EUF-CMA-secure if P_{SS} is hard.

Further constructions:

- ▶ *hierarchical identity-based signatures*
- ▶ *identity-based universal designated verifier signatures*
- ▶ *identity-based ring signatures*

Summary

Our constructions:

- ▶ are almost generic, yet comparable in size and cost.
- ▶ are provably non-delegatable and also offer signer-verifier setting independence.
- ▶ can be extended to generic UMDVS, HIBS, IBUDVS, and IBRS.

However:

- ▶ our security proofs are in the Random Oracle Model.
- ▶ our security reductions are not tight.
