## The Effect of Length on Key Fingerprint Verification Security \& Usability

Dan Turner, Siamak F. Shahandashti, Helen Petrie ePrint: arxiv.org/abs/2306.04574

Paper ePrint

The Context

## Key Fingerprint Verification

## Adversary in the Middle (AitM) Attacks

## Detection of AitM Attacks

## Key Fingerprint Comparison Task

- Ideally needs to be done in an automated way
- e.g. QR code scanning
- Only (fully) matching fingerprints will pass
- When not possible, needs to be done manually
- Nearly matching fingerprints may pass as well
- The focus of this work

Verify security code

$14827 \quad 72128 \quad 20960 \quad 73596$ $9687944651 \quad 77773 \quad 37576$

To verify that messages and calls with are end-to-end encrypted, scan this code on their device. You can also compare the number above instead. Learn more

## Key Fingerprint Variations

- Format
- (Alpha)numeric, e.g. Signal / WhatsApp, Open PGP, SAS
- Words or sentences, e.g. Pretty Easy Privacy
- Graphical, e.g. ASCII art, snowflakes, unicorns
- Comparison mode, e.g. visual or auditory
- Length, e.g. 60 digits for Signal / WhatsApp, 2 words for SAS

The Study

## Study Design

- Signal / WhatsApp numeric key fingerprints
- Conditions: 1, 2, 3 Line(s) corresponding to 20, 40, 60 digits
- Between participants: each does 1 length
- Types: Safe (matching), Adversarial (nearly matching, 1 chunk diff), Random
- Within participants: each does $12+4+4$ in random order

## Tested Hypotheses

- $\mathbf{H ( t \sim l})$ : longer key $\rightarrow$ longer comparison time
- 3 type-specific hypotheses for safe, adv., rand. fingerprints
- H(t~s): higher similarity $\rightarrow$ longer comparison time
- 3 length-specific hypotheses for 1L, 2L, 3L fingerprints
- H(e~l): longer key $\rightarrow$ more errors
- 2 hypotheses: false acceptance / rejection errors

The Results

## Effect of Length on Comparison Time

- Longer key $\rightarrow$ longer comparison time: broadly yes, except for Rand
- Kruskal-Wallis + Wilcoxon (Holm)
- Safe: significant diff 1L-2L-3L
- Adv: significant diff 1L-3L, 2L-3L
- Rand: no significant diff

## Effect of Type on Comparison Time

- Higher similarity $\rightarrow$ longer comparison time: emphatic yes
- Friedman + Nemenyi post hoc
- 1L, 2L, 3L: significant diff safe-adv-rand
- Strong evidence of 'short-circuit evaluation'

## Effect of Length on False Rejection Rate

- Longer key $\rightarrow$ more errors: Not really for FRE
- Kruskal-Wallis
- No significant diff b/w lengths
$\rightarrow$ Users are quite efficient \& effective in recognising dissimilar fingerprints

| \#errors | 1L | 2L | 3L |
| :---: | :---: | :---: | :---: |
| 0 | $92 \%$ | $85 \%$ | $80 \%$ |
| 1 | $6 \%$ | $9 \%$ | $19 \%$ |
| $2-6$ | $0-2 \%$ | $0-2 \%$ | $0-2 \%$ |
| $7-12$ | $0 \%$ | $0 \%$ | $0 \%$ |

| Length | 1L | 2L | 3L |
| :---: | :---: | :---: | :---: |
| Lower Limit | $0.3 \%$ | $1.6 \%$ | $1.1 \%$ |
| Mean Rate | $0.9 \%$ | $2.7 \%$ | $2.0 \%$ |
| Upper Limit | $2.0 \%$ | $4.3 \%$ | $3.4 \%$ |

## Effect of Length on False Acceptance Rate

- Longer key $\rightarrow$ more errors: broadly yes for FAE
- Kruskal-Wallis + Wilcoxon (Holm)
- Significant diff 1L-3L
$\rightarrow$ Users are neither efficient nor effective in comparing highly similar long fingerprints

| \#errors | 1L | 2L | 3L |
| :---: | :---: | :---: | :---: |
| 0 | $72 \%$ | $55 \%$ | $39 \%$ |
| 1 | $15 \%$ | $13 \%$ | $15 \%$ |
| 2 | $8 \%$ | $9 \%$ | $11 \%$ |
| 3 | $0 \%$ | $2 \%$ | $4 \%$ |
| 4 | $6 \%$ | $22 \%$ | $31 \%$ |
| Length | 1L | 2L | 3L |
| Lower Limit | 9\% | 25 $\%$ | $37 \%$ |
| Mean Rate | $\mathbf{1 3 \%}$ | $31 \%$ | $44 \%$ |
| Upper Limit | $\mathbf{1 9} \%$ | $38 \%$ | $50 \%$ |

The Security Implications

## (Full) $2^{\text {nd }}$ Preimage Attack: Finding 2PI

## (Full) $2^{\text {nd }}$ Preimage Attack: Overall Success

## Near $2^{\text {nd }}$ Preimage Attack: Finding N2PI

## Near $2^{\text {nd }}$ Preimage Attack: Overall Success

## Implication of Results on Security

- For adversaries with lower computational budget, manual key fingerprint verification provides a lower security level than usually assumed

## Thank you.
